

Car line patrol based on eight-way line patrol module

Car line patrol based on eight-way line patrol module

1. Introduction

2. Experimental preparation

The relationship between the 4 motor interfaces and the car is as follows:

Hardware wiring:

Wiring using MSPM0 robot expansion board

Wiring using MSPM0G3507 core board (Yahboom)

Wiring pins

3. Key code analysis

4. Experimental phenomenon

1. Introduction

Please read the "Motor Introduction and Usage" in the four-way motor driver board information first to understand the motor parameters, wiring method, and power supply voltage you are currently using. To avoid burning the motherboard or motor.

2. Experimental preparation

National race chassis V2 four-wheel drive version, 4*310 motor, 7.4V lithium battery, eight-way line patrol module, MSPM0 robot expansion board (optional), MSPM0G3507 core board (Yahboom).

The relationship between the 4 motor interfaces and the car is as follows:

M1 -> upper left motor (left front wheel of the car)

M2 -> lower left motor (left rear wheel of the car)

M3 -> upper right motor (right front wheel of the car)

M4 -> lower right motor (right rear wheel of the car)

Hardware wiring:

Wiring using MSPM0 robot expansion board

During the installation and wiring process, if the wiring length is not enough, you can move the MSPM0 robot expansion board forward a little and install it, as shown in the following figure.

Note: The wire used for the eight-way patrol module and the wire used to connect the MSPM0 robot expansion board and the four-way motor drive module are: PH2.0-4pin cable, double-ended all black, reverse (200mm), the direction of the reverse cable holder is shown in the following figure

Wiring using MSPM0G3507 core board (Yahboom)

Wiring pins

Four-way motor driver board	MSPM0G3507 core board (Yahboom)
RX2	PB6
TX2	PB7
GND	GND
5V	5V

Take the M1 motor as an example below, and other motors are similar

Motor	Four-way motor driver board (Motor)
M2	M1-
VCC	3V3
A	H1A
B	H1B
GND	GND
M1	M1+

Eight-way line patrol module	MSPM0G3507 core board (Yahboom)
5V	5V
SCL	PA15
SDA	PA16
GND	GND

3. Key code analysis

```

- Set_Motor: This function is used to store the parameters of the motors sold in our store. By modifying the MOTOR_TYPE parameter at the beginning of empty.c, one-click configuration can be achieved. Under normal circumstances, do not modify the code here when using the motors of our store. If you use your own motors, you can select any motor and change the parameters to the parameters of the motor you use. If you do not understand the meaning of these parameters, you can check the document "4-way motor driver board control instructions" to understand the specific meaning of each instruction.
- Motion_Car_Control: Control the movement of the car
- app_motor_usart.c

```

//发送电机类型      Transmitter motor type
void send_motor_type(motor_type_t data)
{
    sprintf((char*)send_buff, "$mtype:%d#", data);
    Send_Motor_ArrayU8(send_buff, strlen((char*)send_buff));
}

//发送电机死区      Send motor dead zone
void send_motor_deadzone(uint16_t data)
{
    sprintf((char*)send_buff, "$deadzone:%d#", data);
}

```

```

        Send_Motor_ArrayU8(send_buff, strlen((char*)send_buff));
    }

    //发送电机磁环脉冲 Send motor magnetic ring pulse
    void send_pulse_line(uint16_t data)
    {
        sprintf((char*)send_buff, "$mline:%d#", data);
        Send_Motor_ArrayU8(send_buff, strlen((char*)send_buff));
    }

    //发送电机减速比 Transmitting motor reduction ratio
    void send_pulse_phase(uint16_t data)
    {
        sprintf((char*)send_buff, "$mphase:%d#", data);
        Send_Motor_ArrayU8(send_buff, strlen((char*)send_buff));
    }

    //发送轮子直径 Send wheel diameter
    void send_wheel_diameter(float data)
    {
        sprintf((char*)send_buff, "$wdiameter:%.3f#", data);
        Send_Motor_ArrayU8(send_buff, strlen((char*)send_buff));
    }
}

```

Send the motor parameters to the four-way motor driver board through the serial port

- empty.c

```

#define MOTOR_TYPE 2 //1:520电机 2:310电机 3:测速码盘TT电机 4:TT直流减速电机 5:L型520电机
//1:520 motor 2:310 motor 3:speed code disc TT motor 4:TT DC reduction motor 5:L type 520 motor
int main(void)
{
    USART_Init();//打印串口初始化 Print serial port initialization
    printf("please wait...\r\n");

    //使能DMA通道 Enable DMA Channel
    NVIC_ClearPendingIRQ(UART_1_INST_INT_IRQN);
    DL_DMA_enableChannel(DMA, DMA_CH0_CHAN_ID);
    NVIC_EnableIRQ(UART_1_INST_INT_IRQN);

    //设置电机类型 Set motor type
    Set_Motor(MOTOR_TYPE);

    //修改电机PID, 这里的参数是为四驱310底盘配置的, 其他底盘需要自己测试修改
    //Modify the motor PID, the parameters here are configured for the 4WD 310 chassis, other chassis need to test and modify their own!
    send_motor_PID(1.9, 0.2, 0.8);

    printf("Initialization Succeed\r\n");

    while(1)
    {
        Linewalking();//开始八路巡线 Starting eight-way patrols.
    }
}

```

```
}
```

- MOTOR_TYPE: Change to the motor type you are using
- USART_Init: Initialize the serial port for communicating with the four-way motor driver board
- Set_Motor: Set the motor type
- send_motor_PID: Set the motor PID
- LineWalking: Control the car to patrol the line

4. Experimental phenomenon

Connect the car, burn the program to MSPM0, and put the car on the map with white background and black lines. The map adapted for this project is the high-difficulty map sold in our store, which is adapted to the chassis of the four-wheel drive 310. If the patrol line effect of other chassis is not good, you need to modify the motor PID and patrol line PID in the code. Plug in the power supply. (It is recommended to calibrate the module before patrolling the line), and the car will patrol the black line.
